

DelPro 1238™ & DelPro 1638™ MAINTENANCE & CLEANING INSTRUCTIONS

We recommend the following maintenance and cleaning program to keep your panels looking great. Never use abrasive cleaners, chemicals, or brushes on your panels, and it is always a good idea to test a cleaner on a small area of panel. A few things to consider when discussing which cleaners to use with cleaner suppliers are the environment your panels are in (carwash, residential, or agricultural), your type of water (soft or hard), types of grease in your carwash bay, and soil type for your area (clay, etc.). Do not use cleaners that are solvent based (anything distilled) or contain a caustic acid.

Maintain — When properly maintained, our rigid virgin PVC maintains its original profile and gloss. Use a soft brush or damp cotton cloth to wipe down the panels as needed. Your panels may be wiped down using off-the-shelf lime and soap scum removal products.

Clean — For cleaning our panels, we recommend a mild detergent. Soap scum removers work very well. You may also use a low-pressure washer, low heat water/steam, a soft cloth, Simple Green- or other multi-purpose cleaners.

Car Wash Recommended Cleaners — Follow manufacturer directions carefully!
